Pipe Shoes are a type of pipe supports used to support insulated piping and to transfer loads and forces to a pipe's support structure. Also, a pipe shoe on a non-insulated line can function as a wear plate to protect against corrosion at the pressure boundary of a pipe's wall.

RedLineIPS pipe shoes are Cogbill's signature, heavy-duty pipe shoes fabricated to meet our customers' special needs, suitable especially for the chemical and petrochemical industries, including off-shore facilities. Fabricated from carbon steel with optional HD galvanizing, or from stainless steel, we can accommodate a variety of needs and customizations. Welded or non-welded; utilizing clamps or U-bolts; with cradles and optional liners such as PTFE, Neoprene, and PVC, among other material to protect against corrosion and vibration; we have solutions for a variety of needs. Our custom pipe shoes have been withstanding the test of time and the elements since 1999.
